Create 2 REST services: one that allows to register a user and the other one that displays the details of an registered user. You don't need to spend too much time on this exercise – few hours, the goal is to be able to quickly check your code !

Requirements:
- define a user (what are the fields needed). We should have mandatory and optional fields!
- validate the input and return proper error messages/http status
- log the input and output of each call and the processing time.
- have a request parameter which is not mandatory and which provides a default value in case is not set
- have a path variable
- clear code and javadoc
- unit tests
- only adults (age > 18 years) and that live in France can create an account!

Bonuses:
- user a non-relational DB in order to save the users!
- use AOP
- documentation/UML/schemas to explain the architecture
